

Course 5 - Sprint 5: Perform Operations on a Sequence of Collection Objects Using Stream API

Problem Statement: C5S5PC5.1 – Cricket Tournament

For an international cricket tournament, data of cricket players participating from different countries has been collected. The tournament board needs to search, analyse, and extract information from the list.

Create a program that performs the following activities:

1. Given a country and a name, find the cricketer from the entire data list of cricket players
2. Sort the list of cricketers in alphabetical order of their names belonging to a particular country.
3. Search for cricketers who have played more than 50 matches
4. Find the cricketers who have scored the highest runs for their country
